Generating API Client

Before applications can interact with the Project that has been created in previous step, an API Client needs to be setup first. API Clients include authentication information and permission scopes to determine what endpoints the API Client can interact with. Please follow this link ⬡ Get your API Client to see the steps required for creating the API Client.

⚠ When generating the API Client, give only scopes which are required for a Service. If its for Admin purpose, select Admin Client from the drop down, and scopes will be selected automatically

Sharing the API Client

Once API Client is generated, please share the API Client details such as key and secret using the https://yopass.aws.lllint.com/#/ with the concerned person

Validating the API Client

Please follow this link ⬡ Make your first API call to validate the API Client that has been generated

References

Steps are documented here for ease. These steps can be referenced from ⬡ Initial Project setup as well
